

MacKenzie Paul ICPS 2023 Conference Experience

Attending the ICPS 2023 research conference was a truly incredible experience. It was an opportunity for me to learn, network, and present my research to a global community of researchers. One of the highlights of the conference was the chance to catch up with one of my advisors. We had the opportunity to discuss my current research and future plans. I received valuable feedback on my work, which helped me to refine my research objectives and methodology for our collaborative project. During the conference, I also had the opportunity to make connections with researchers who shared similar research interests. It was a great opportunity to discuss our work and to exchange ideas. Through these connections, I was able to learn about new theories and approaches that I could incorporate into my own research. One of the most exciting parts of the conference was attending the talks. There were so many interesting presentations, and I had a hard time choosing which ones to attend. I ended up attending talks on topics such as well-being, awe and flourishing, and the effects of SES on moral judgment. The speakers were all experts in their respective fields, and I learned a lot from their insights.

Another great aspect of the conference was the chance to present my research to the international research community. I had the opportunity to share my findings with a diverse audience and to receive feedback on my work. Presenting at the conference was an incredible opportunity to showcase my research and to receive constructive criticism from my peers. Overall, attending the ICPS 2023 conference was a great learning and networking opportunity for me. I was able to catch up with my advisor, make connections with researchers with similar interests, attend talks, learn about new theories to incorporate into my research, and present to the international research community. The experience has inspired me to continue to pursue my research goals and to engage more deeply with the global research community.
